The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' incron-exon junctions, 5' or 2' end genomic flanking regions, 5' and 3' incron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or assal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense year therapeutic respiratory effect of an expiratory steptory, lung or therapeutic respiratory effect of an antishmantory steroid in a subject, for reducing levels of denosine receptor, producing bronchodilation, increasing levels of denosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung suffactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 13813; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antiense to the initiation codon, coding regaion, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. In composition for treating or preventing a respiratory, lung or malignant disease or condition, also for reducing sensitivity to adenosine, reducing levels of an antiinflammatory steroid in a subject, for reducing levels of adenosine, receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

The compositions comprise antisense compounds, Dempositions and mentions of modulating the expression of interferon gamma receptor 1 (The Compositions comprise antisense compounds, particularly antisense oligonucleotides, tragetted to nucleic acids encoding FRORI. The associated with IPNGRI, such as an autoimmune disorder (e.g. diabetes, autoimmune hypotolis, multiple sclerosis, autoimmune arthritis, autoimmune insulinitis or Crohn's disease), cancer or a disease or condition caused by aberrant apoptosis. It is also used for inhibiting the expression of IFNGRI, as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway, as prophylactic agents (e.g. to prevent or delay infection, inflammation or tumour formation), and as probes or primers. It is also used in the targetted to human IFNGRI DNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                 /mod_base= OTHER

```
The invention relates to methods for identifying regions of neoplastic growth in a human patient, especially for detecting or predicting metastasis. The methods involve determining whether a neoplastic growth marker protein is overexpressed, either by the use of an antibody consocial protein, or by the use of FCR or hybridisation to detect mucleic acids encoding the marker proteins. A set of neoplastic growth marker: The neoplastic growth marker: The neoplastic growth marker: The neoplastic growth markers are specifically expressed at a higher level in metastatic growth markers are specifically expressed at a higher level in metastatic growth markers are specifically expressed at a higher level in metastatic growth markers with advanced and early stage cancers and normal cells from which the cancer is derived.

CC Overexpression of the neoplastic growth markers is taken as an indication that the tissue has a propensity to metastasise. The invention also encompasses methods for treating aptient with an advanced or metastatic cancer. and for identifying candidate drugs for treating advanced or metastasis, or identifying candidate drugs for treating advanced or detastasis, or identifying candidate drugs for treating advanced or concert in the invention is particularly applicable to destation the neoplastic growth marker proteins are additionally concerted the neoplastic growth marker proteins are additionally concerned the present sequence of the neoplastic growth marker proteins are additionally concerned the present sequence or the present sequence represents a personner measurement and personner or the present sequence represents and the present sequence represents and sequence or the present sequence or the present sequence or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence represents a PCR primer used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying regions of neoplastic growth in a human body, useful for detecting or predicting metastasis, comprises administering to the human body an antibody or peptide that specifically binds to a protein marker of neoplastic growth.
                                                                                                                                                                                                                      Metastasis; neoplastic growth; detection; prediction; neoplastic growth marker; drug screening; cancer; tumour; gastrointestinal; prostate; breast; colorectal; diagnostic imaging; drug targeting; chromosome 8q24.3; human; protein tyrosine phosphatase type IVA member 3; PRL-1; gene mapping;
                                                                                                                                                                        Suman PRL-3 reverse PCR primer #178, used in gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 20 BP; 7 A; 6 C; 5 G; 2 T; 0 U; 0 Other;

Primers useful for predicting the likelihood of obesity

Claim 1; SEQ ID NO 6; 7pp; Korean.

The invention relates to PCR primers (ADL16104-ADL16111) for use in the analysis of single nucleotide polymorphisms (SNPs) in the human lipoprotein lipase (PLP) gene (GenBank accession numbers AFG50163) which are associated with a predisposition to obesity. The invention also encompasses a kit comprising a pair of sense and antisense primers. The primers and kit can be used to predict the likelihood of an individual developing obesity, so that it can be prevented. The present sequence represents a specifically claimed human LPL reverse PCR primer of the invention.

WPI; 2003-093058/08.

S Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 6827; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating comprising oligonuclectides, effective for alleviating construction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The coligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention also antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, ung or malignant disease. The administered composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The composition or vasilability, or to increase the degradation of the target many or to increase the degradation of the target many or inflammation, allergies and/or bruckctont hypoproduction are associated inflammation, allergies, asthma, impeded respiration, respiratory disease or condition such as pulmonary disease, pulmonary continual disease or condition such as pulmonary disease, pulmonary continual disease or condition such as pulmonary disease, pulmonary continual disease or condition such as pulmonary disease, pulmonary continual disease or condition such as pulmonary disease, pulmonary continual decrease in the target RNA serves to prevent the brackener.

The reduced adenosine content of the anti-sense oligos corresponding to thy information and propertions pulmonary infections, pulmonary entry of prevent the barders and content of th prevent any unwanted effects due to it the system the oligonucleotides into products that free adenosine into

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of the invention for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition and/or lung and all administered to reduce the amount of target polypeptide present in the lungs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             with a disease or condition such as unanary uspontouccion are associated with a disease or condition such as unanary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation repetition, pulmonary infections, bronchitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inflammation, allergies and/or surfactant hypoproduction are associated

expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers; (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, ing or malignant disease. The administered composition or availability, or to increase the degradation of the target mRNA or to
                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                             Human, antisense; bronchoconstriction, allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic, antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; pulmonary hypertension; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene, encoding or regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                        Gaps

dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, antiagesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or reduce the amount of target polypeptide present in the lungs. The pullmonary obstruction, and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary vasoconstriction.

ô

expression of a target polypeptide associated with lung airway or lung

inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system

e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

```
inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, configuration or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a contraction as a caspiratory, lung or malignant disease. The administered or educe the amount of target polypeptide present in the lungs. The composition and/or bronchoconstriction and/or lung cinflammation, allergies and/or surfactant hypoproduction are associated distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary chremation, replection, pulmonary infections, bronchits or cancer. The reduced adenosine content of the anti-sense oligos or cancer. The reduced adenosine content of the anti-sense oligos or corresponding to thymidines present in the target RNA serves to prevent the breakdown of the ling process of the oligonic content of the anti-sense oligos or cancer. e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and Human, antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; Pabalan J, Aguilar D; ô 0.4%; Score 15.2; DB 1; Length 20; 55.0%; Pred. Claim 15; SEQ ID NO 4304; 763pp; English

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, readiction, allevials allexials and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, cautefactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antisiflammatory, antisathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to composition compute of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated inflammation. inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. ung, brain, heart, kidney, etc, tissue environment and thereby, to The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system prevent any unwanted effects due to it

Katz E, Pabalan J, Aguilar D; Li Y, Sandrasagra A, K. Tang L, Shahabuddin S; Miller S, Nyce JW,

WPI; 2003-093058/08.

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and oronchodilating agent.

Claim 15; SEQ ID NO 6974; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, configurate derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung aypenction also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiactmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary vasoconstriction, continued, path, cystic fibrosis, allergic rhintis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, ecc, tissue environment and thereby, to prevent any unwanted effects due to it

inhibiting the expression of sterol regulatory element-binding protein-1

con cells or tissues (by contacting the cells or tissues with the compound

contact expression of sterol regulatory element-binding protein-1 is

conhibited) and treating an animal having a disease or condition

casociated with sterol regulatory element-binding protein-1 by

compound so that expression of sterol regulatory element-binding protein-1

compound so that expression of sterol regulatory element-binding protein-

compound so that expression of sterol regulatory element-binding protein-

compound so that expression of sterol regulatory element-binding protein-

compound so that expression of sterol regulatory element-binding protein-1, such as a more modified nucleobase (preferably 2.0-methoxyethyl sugar

compety) or at least one modified nucleobase (preferably 5.

methylcytosine). The compound, composition and methods are useful for

treating a disease or condition associated with sterol regulatory element

contacting protein-1, such as a metabolic disorder e.g. diabetes, or a binding protein-1, such as a metabolic disorder e.g. diabetes, or a cardiovascular disorder, e.g. atherosclerosis or hyperlipidaemia. They

are also useful in research and diagnostics for modulating the expression of sterol regulatory element-binding protein-1. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleota acid molecule encoding sterol regulatory element-binding protein-1 (SREBP-1, also known as sterol regulatory element-binding transcription factor, SREBF), and inhibits the expression of SREBP-1, i.e. is an antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding sterol regulatory element-binding protein-1, useful for treating diabetes, atherosclerosis or hyperlipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            julatory element-binding transcription factor; SREBF; disorder; diabetes; cardiovascular disorder; atherosclerosis;

hybridises with at least an 8-nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding sterol regulatory element-binding protein-1, a composition comprising the compound and a carrier or diluent, in cells or tissues (by contacting the cells or tissues with the compound so that expression of sterol regulatory element-binding protein-1 is contacted with sterol regulatory element-binding protein-1 is ansociated with sterol regulatory element-binding protein-1 by administering to the animal a therapeutic or prophylactic amount of the compound so that expression of sterol regulatory element-binding protein-1 by administering to the animal at therapeutic or prophylactic amount of the compound so that expression of sterol regulatory element-binding protein-1 is inhibited. The antisense oligonuclectide comprises at least one modified sugar moiety (preferably 2'-0-methoxyethyl sugar moiety) or at least one modified nucleobase (preferably 5-methoxyethyl sugar moiety) or at least one modified nucleobase (preferably 5-methoxyethyl sugar creating a disease or condition associated with sterol regulatory element to treating a disease or condition as a metabolic disorder e.g. diabetes, or a cardiovascular disorder, e.g. atherosclerosis or hyperlipidaemia. They are also useful in research and diagnostics for modulating the expression of thuman SREBP-1 target region for the antisense oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 7 A; 7 C; 3 G; 3 T; 0 U; 0 Other;

Human glucocorticoid receptor-specific antisense oligonucleotide #4377. ADH67543 standard; DNA; 20 BP. ADH67543; RESULT 290 

25-MAR-2004 (first entry)

antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetees; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOB.

WPI; 2004-035034/03.

New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, mammalian glucocorticoid receptor, useful for treating diabete cardiovascular disorder, hyperlipidemia or Cushing's syndrome

Claim 4; SEQ ID NO 4377; 985pp; English.

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The

                delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human gluccorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises an antisense oligonucleotides that are targeted antisense acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

The present invention relates to antisense compounds targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-1 (IRA-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of IRAK-1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one addition internucleoside linkage, preferably a phosphorothioate linkage. The also comprises at least one modified sugar moiety, preferably a 2'-0- methoxyethyl (2'-MOB) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5- methoxyethyl (2'-MOB) sugar moiety. The antisense oligonucleotide further methylcytosine. The antisense oligonucleotides are useful for the reatment of diseases such as hyperproliferative disorders, e.g. cancer, autoimmune disorders, altered bone metabolism, and inflammation. The present sequence represents an antisense oligonucleotide used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                              Antisense therapy; human; interleukin-1 receptor-associated kinase-1; IL-1 receptor-associated kinase-1; IRAK-1; hyperproliferative disorder e.g.; cancer; autoimmune disorder; altered bone metabolism or inflammation; cytostatic; immunosuppressive; osteopathic; antiinflammatory; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mod_base= OTHER //mod_base a phosphorothioate //note= "This oligonuclectide has a phosphorothioate backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 5 mucleotides in length at each end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New compound having a sequence targeted to a nucleic acid encoding II receptor-associated kinase-1, useful for preparing a composition for treating hyperproliferative or autoimmune disorder or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20 BP; 4 A; 6 C; 7 G; 3 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                               Human IRAK-1 DNA, antisense oligonucleotide #49.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 15, SEQ ID NO 62; 66pp; English.

The present invention relates to antisense compounds targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-1 (IRAK-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of IRAK-1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide is a chimeric comprises at least one modified comprises at least one modified sugar moiety, preferably a 2'-0- It also comprises at least one modified sugar moiety, preferably a 2'-0- methoxyethy! (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 2'-0- comprises at least one modified nucleobase, preferably a 2'-0- comprises at least one modified nucleobase, preferably a 2'-0- comprises at least one modified nucleobase, preferably a 2'-0- comprises at least one modified nucleobase, preferably a 2'-0- comprises at least one modified nucleobase, preferably a 2'-0- comprise at least one modified nucleobase, preferably a 2'-0- comprise at least one modified nucleobase, preferably a 2'-0- comprise at least one modified nucleobase, preferably a 2'-0- comprise at least one metabolism, and inflammation. The present sequence represents a human IRAK-1 DNA target sequence for an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New compound having a sequence targeted to a nucleic acid encoding IL-1 receptor-associated kinase-1, useful for preparing a composition for treating hyperproliferative or autoimmune disorder or inflammation.
                                                                                                                                                                                                                                                                                                   Antisense therapy; human; interleukin-1 receptor-associated kinase-1; IL-1 receptor-associated kinase-1; IRAK-1; hyperproliferative disorder e.g.; cancer; autoimmune disorder; altered bone metabolism or inflammation; cytostatic; immunosuppressive; osteopathic; antiinflammatory; ds.

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisence oligonucleotide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a human cyclin dependent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonucleotide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a human cyclin dependent kinase 4 antisense oligonucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a compound (1) of 8-80 nucleobases in length targeted to a nucleic acid molecule encoding polo-like kinase, where (1) specifically hybridises with nucleic acid molecule encoding polo-like kinase and inhibits the expression of polo-like kinase, or specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding polo-like kinase. Also described: (1) a composition comprising (1) and a planamaceutical carrier or diluent; (2) inhibiting the expression of polo-like kinase in cells or tissues comprising contacting the cells or tissues with (1); (3) treating an animal having a disease or condition associated with polo-like kinase comprising administering to the animal at the rapeutic or prophylactic amount of (1) so that expression of polo-like kinase is inhibited; and (4) screening for an antisense compound comprising a preferred target region of a nucleic acid molecule encoding polo-like kinase with one or more candidate antisense compounds with one or more candidate antisense compounds which inhibits the expression of a compounds comprising at least an 8-nucleobase portion which is complementary to the preferred target region, and selecting for one or more candidate antisense compounds which inhibits the expression of a cutiented antisense compounds which inhibits. The antisense contolides or compounds (1) can be used for inhibiting the artisense decompounds (1) can be used for inhibiting the expression of polo-like kinase, and can be used in a sesociated with aberrant expression of polo-like kinase, including non-small cell ung research reagents and kits, or in diagnostic, therapeutic applications, e.g. to prosphylactic applications, e.g. to prosphylactic applications, e.g. to present or despay infection, inclummation or tumour formation. The present sequence represents a human of polo-like presents and entime or inflammation or tumour formations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compounds targeted to nucleic acid molecules encoding polo-
like kinae, useful for treating diseases associated with aberrant
expression of polo-like kinase, e.g. non-small cell lung cancer or
esophageal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polo-like kinase target oligonucleotide, which is used in an example from
                                                                                                                                                                                                         polo-like kinase; polo-like kinase inhibitor; antisense oligonucleotide; cytostatic; antiinflammatory; antimicrobial; antisense gene therapy; kinase inhibitor; hyperproliferative disorder; cancer; non-small cell lung cancer; oesophageal cancer; infection; inflammation; tumour; human; target; se.
                                                                                                    Human polo-like kinase target oligonucleotide SEQ ID NO:114.

The present invention describes a compound (1) of 8-80 nucleobases in length targeted to a nucleic acid molecule encoding polo-like kinase, where (1) specifically hybridises with nucleic acid molecule encoding polo-like kinase and inhibits the expression of polo-like kinase, or specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding polo-like kinase. Also described: (1) a composition comprising (1) and a charmaceutical carrier or diluent; (2) inhibiting the expression of polo-like kinase in cells or tissues comprising contacting the calls or tissues with (1); (3) treating an animal having a disease or condition associated with polo-like kinase comprising administering to the animal a charpettic or prophylactic amount of (1) so that expression of polo-like kinase is inhibited; and (4) screening for an antisense compound comprising contacting a preferred target region of a nucleic acid molecule encoding polo-like kinase with one or more candidate antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compounds targeted to nucleic acid molecules encoding polo-
like kinase, useful for treating diseases associated with aberrant
expression of polo-like kinase, e.g. non-small cell lung cancer or
esophageal cancer.
                                                                                                                                                                                                                                                                                                                         note = "phosphorothioate linkages"

compounds comprising at least an 8-nucleobase portion which is complementary to the preferred target region, and selecting for one or more candidate antisense compounds which inhibits the expression of a nucleic acid molecule encoding polo-like kinase. (1) has cytostatic, antisense gene therapy, and as a kinase inhibitor. The antisense antisense gene therapy, and as a kinase inhibitor. The antisense conjugance or compounds (1) can be used for inhibiting the expression of polo-like kinase, and for treating diseases or conditions associated with aberrant expression of polo-like kinase, e.g. hyperproliferative disorder such as cancer, including non-small cell lung cancer or oesophageal cancer. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human polo-like kinase chimeric phosphorchicate antisense oligonucleotide, which is used in an example from the present invention.

New antisense compound targeted to a nucleic acid molecule encoding requiem, useful for modulating expression of requiem or for treating cancer or developmental disorders.

Example 15; SEQ ID NO 50; 66pp; English.

antisense compound can also be used as research tools and diagnostics. It can also be used as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of The invention relates to a compound targeted to a nucleic acid molecule encoding requiem which specifically hybridises with the nucleic acid molecule encoding requiem and inhibits the expression of requiem. The compound, particularly the antisense oligonucleotide is useful in modulating the function of nucleic acid molecules encoding requiem. The 

for treating diseases or conditions associated with requiem, preferably hyperproliferative disorder, e.g. cancer or a developmental disorder. The compound can also be used as prophylaxis, e.g. to prevent or delay inflection, inflammation or tumour formation. The present sequence represents the human requiem antisense oligonucleotide. expressed within cells and tissues. The compound can also be used 858888888

The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the cligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(iss), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CPDD), allergic rhinitis (AR), acute respiratory distress syndrome (CDDD), allergic rhinitis (AR), acute respiratory bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

```
New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding resistin, useful for treating a metabolic disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding resistin, and inhibits the expression of resistin. The compound, composition and methods are useful for treating a disease or condition associated with resistin, such as a metabolic disease, e.g. diabetes or obesity, or atherosclerosis. They are also useful in research and diagnostics for modulating the expression of resistin. This sequence

The invention relates to a method for treating airway hyperresponsiveness or pulmonary inflammation in an individual comprising administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention also relates to a method of inhibiting expression of a nucleic acid molecule encoding B7-1 or B7-2. The antisense compound is an antisense oligonucleotide which has a modified sugar molecy and nucleobase. The human B7 protein is human B7-1 or B7-2 protein or both. The compound is useful for treating airway hyperresponsiveness or pulmonary inflammation, which is associated with asthma, by inhibiting expression of human B7 protein. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating airway hyperresponsiveness or pulmonary inflammation comprises administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein to the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    B7 protein. This sequence the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                 Airway hyperresponsiveness; pulmonary inflammation; antisense oligonucleotide; human; B7 protein; B7-1; asthma; antiasthmatic; antiinflammatory; 8s.

The invention relates to a method for treating airway hyperresponsiveness or pulmonary inflammation in an individual comprising administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention also relates to a method of inhibiting a human expression of a nucleic acid molecule encoding B7-1 or B7-2. The antisense compound is an antisense oligomucleotide which has a moified sugar moiety and nucleobase. The human B7 protein is human B7-1 or B7-2 protein or both. The compound is useful for treating airway propensiveness or pulmonary inflammation, which is associated with asthma, by inhibiting expression of human B7 protein. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense therapy; mouse; complement component C3; autoimmune disorder; multiple sclerosis; infection; atherosclerosis; neuroprotective; antiarteriosclerotic; antimicrobial; antiinflammatory; cytostatic; phosphorothioate; ss.

The present invention relates to antisense compounds targeted to a nucleic acids encoding human and mouse complement component C3. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of complement component C3 in cells. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at chast one modified internucleoside linkage, preferably a phosphorothhoate linkage. It also comprises at least one modified augar moiety, preferably a 2'-0-methoxyethyl (2'-MOB) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-cmethylytosine. The antisense oligonucleotide is an entisense such as autocimmune disorders e.g. multiple creament of diseases such as autocimmune disorders e.g. multiple selezosis, infections, and atherosclerosis. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; \operatorname{HDL}; cardiovascular disorder; \operatorname{metabolic} syndrome X_i ss.

                                                                                                                                                                                                                                                            New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                               /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothicate
backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 4 nucleotides in length. Also all
cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antilipaemic, Cardiovascular, Analgesic, Antianginal, Antisense therapy, Human, Endothelial Lipase; dyslipidaemia, high density lipoprotein, HDL, cardiovascular disorder, metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                       The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
/note= "This oligonucleotide has a phosphorothioate backbone and 2-"methyoxyethyl (2-'MCB' wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 4 nucleotides in length. Also all
cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

; 0 New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders. The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits. The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3. e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy, or ataxia. The present cepresents a chimeric phosphorothicate oligonucleotide with 2.MOB wings and a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligonucleotides are designed to target Gaps ö Match 0.4%; Score 15.2; DB 1; Length 20; Local Similarity 85.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition neuropathle pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to monatal or infantile epilepsy, or ataxia. The present sequence represents a chimeric phosphorothioate oligonuclectide with
                                                                                                                                                                                                                                                                                                                                   New antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                          Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chimeric phosphorothioate oligonucleotide to target Nav1.3 #4162.

The present invention relates to an antisense compound targeted to a mucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition neuropaths the pain including but not limited to neuropaths pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neonatal or infantile epilepsy, or ataxia. The present sequence represents a chimeric phosphorothioate oligonuclevide with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chimeric phosphorothioate oligonucleotide to target Nav1.3 #1129.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

nucleic acid molecule encoding Navi. 3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi. 3. The compound and composition are useful for treating a disease or condition associated with Navi. 3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate olisonucletide with
                    Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lipford G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immunostimulatory nucleic acid; asthma; allergy; cancer; infectious disease; autoimmune disease; airway remodeling; chronic obstructive pulmonary disease; asthma; II-6; interleukin-6; TNFalpha; tumour necrosis factor alpha; IFNalpha; interferon-alpha; IFNalpha; interferon-gamma; IP-10; interferon inducible protein; viral infection; bacteria infection; parasitic infection; ss.
New antisense compound targeted to a nucleic acid molecule encoding
                                                                                                                                                                                                                                                                     The present invention relates to an antisense compound targeted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.4%; Score 15.2; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeninal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonuclectide with
                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding abav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache;

Used during the antisense inhibition of human NaV1.3 expression, the oligonucleotides are designed to target different regions of the human NaV1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3; Indels

```
The invention relates to an immunostimulatory nucleic acid molecule comprising an internal pyrimidine-purine (YZ) dinucleotide and chimeric backbone, where one internal YZ dinucleotide has a phosphodiester(-like) internal variational internal YZ dinucleotide ach additional internal YZ dinucleotide linkages are stabilised. The cligonucleotide linkages are stabilised. The cligonucleotide is useful in stimulating or modulating an immune response. The medicament shifts the immune response to a Thi biased response. The oligonucleotide is also useful in the manufacture of a medicament for treating as thin allergy, cancer, intectious disease, autoimmune disease, airway remodeling or chronic obstructive pulmonary disease or in treating a subject who is a smoker or who is free of symptoms of asthma. The oligonucleotide is useful in corrective pulmonary disease or in treating a subject who is a smoker or who is free of symptoms of asthma. The oligonucleotide is useful in correction and in treating and preventing infections caused by viruses, also useful in treating and preventing infections caused by viruses, immunication and preventing infections caused by viruses, immunication; and paresters and preventing infections caused by viruses, immunication; imminications caused by viruses, immunication; imminications caused by viruses, immunication; imminications caused by viruses.
asthma, allergy, cancer, infectious disease, autoimmune disease or airway remodeling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; 88; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Eccaxin-1; RANTES; MCP4; CD23; ICAM; UCAM; tryptase a; tryptase b; PD84 B; PD84 C; PD84 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.

```
The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) crossen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) crossen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) crossen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) crossen from a gene encoding darget(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a coligonucleotides are useful for reducing or inhibiting expression of a crospiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a crospiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A creeptor(s), and/or asthma and/or lung allergie associated with crossing colificammation or an inflammation, allergy, asthma, impeded respiration, crossing (CP), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary crossing crossing crospiratory distress syndrome, pulmonary crossing 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                           Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Ectaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PD24 A; PDE4 C; PDE4 C; PDE4 C; PDE4 C; PDE5 C;

15-JUL-2004 (first entry)

Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g. A, Tang L, Aguilar D, Miller S; Cong H; Claim 2; SEQ ID NO 1277; 174pp; English. Sandrasagra A, Shahabuddin S, Lu H,

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 mucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, Tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(8) or expressed product(8), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, pDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A inflammation or an inflammation, allergy, asthma, impeded respiration, cleaned from airway inflammation, allergy, asthma, impeded respiration, allergic fibrosis (CP), chronic obstructive pulmonary or lung disease is considered with inflammation, allergy, asthma, impeded respiration, hypertension, lung inflammation, bronchitis, airway obstruction or hymerican. This sequence represents an oligonucleotide of the

Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g. asthma.

Claim 2; SEQ ID NO 2279; 174pp; English.

The invention relates to oligonuclectides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (1L)-4 receptor, interleukin (1L) coseptor, cCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, LTYptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, creptratory or lung disease is associated with hyper-responsiveness to useful for preventing or treating a respiratory or lung disease. The creptor(s), and/or asthma and/or lung allergies associated with creased levels of adenosine A creceptor(s), and/or asthma and/or lung allergies associated with creased levels of adenosine A creceptor(s), and/or asthma and/or lang allergy, asthma, impeded respiration, cystic. fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory discress syndrome, pulmonary disponention or hypertension, lung inflammation, bronchiefs, and allergy and allergic rhinitis, acute respiratory discress syndrome, pulmonary disponention or hypertension, lung inflammation, bronchiefs, and decomposite and allergic rhinitis, acute respiratory discress syndrome, pulmonary disponention or hypertension, allergic rhinitis, acute respiratory discress syndrome, pulmonary disponention or hypertension, lung inflammation, bronchiefs, and decomposite and decomposited ronchoconstriction. This sequence represents an oligonucleotide of the

```
The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding Cytokine-inducible kinase. The compound specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase (which comprises a sequence of 2169 bp fully defined in the specification) and inhibits the expression of Cytokine-inducible kinase (which comprises a sequence of 1869 bp fully defined in Cytokine-inducible are: a method of inhibiting the expression of Cytokine-inducible kinase in cells or tissues, comprising contacting the cells or tissues with the new compound so that the expression of Cytokine-inducible kinase is inhibited; a method of screening for a modulator of Cytokine-inducible kinase, comprising contacting a preferred target segment of the nucleic acid encoding Cytokine-inducible kinase with one or more candidate modulators of Cytokine-inducible kinase with one
                                                                                                                                                                                                                                                                                                                     cytokine-inducible kinase inhibitor; antisense technology; cytokine-inducible kinase expression; hyperproliferative disorder; human; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= b

identifying one or more modulators that modulate the expression of
Cytokine-inducible kinase, a diagnostic method for identifying a disease
state, comprising identifying the presence of Cytokine-inducible kinase
in a sample using at least one of the primers or probe comprising the
nucleotide sequences as mentioned in the specification; a kit or assay
device comprising the above compound, and a method of treating an animal
having a disease or condition associated with Cytokine-inducible kinase,
comprising administering to the animal a therapeutic or prophylactic
amount of the compound so that expression of Cytokine-inducible kinase in
inhibited. The antisense oligonucleotide is useful for inhibiting the
expression of Cytokine-inducible kinase in cells or tissues to prevent or
treat diseases associated with the kinase expression, such as
hyperproliferative discorders. In addition, the compound is used for
diagnostics, prophylaxis, or as research reagents or kits. This sequence
represents a human cytokine-inducible kinase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                  ö

The interior describes a compount of the interior action of the compound specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase. The compound inhibits the expression of Cytokine-inducible in the specification) and inhibits the expression of Cytokine-inducible kinase (which comprisis comprising contacting the expression of Cytokine-inducible kinase in cells or tissues, comprising contacting the colls or tissues with the new compound so that the expression of Cytokine-inducible kinase, comprising contacting a preferred target segment of the nucleic acid encoding Cytokine-inducible kinase, and compression of Cytokine-inducible kinase, comprising contacting a preferred target segment of the nucleic acid encoding Cytokine-inducible kinase, and compression of Cytokine-inducible kinase, and compression of cytokine-inducible kinase, and dentifying the presence of Cytokine-inducible kinase is take, comprising identifying the presence of Cytokine-inducible kinase is take, comprising the above compound; and method of treating an animal device comprising the above compound; and a method of treating an animal device comprising the above compound; and a method of treating an animal computation as of the animal a therapeutic or prophylactic amount of the antisense oligonucleotide is useful for inhibiting the expression of Cytokine-inducible kinase is inhibited. The antisense oligonucleotide is useful for inhibiting the expression of cytokine-inducible kinase is contracted and the cytokine-inducible kinase is comprising administering the difference of cytokine-inducible kinase is comprising administering the difference of cytokine-inducible kinase is comprising administering the difference of comprision of cytokine-inducible kinase is comprised to that expression of Cytokine-inducible kinase is comprised to the compound of the antisense of cytokine-inducible kinase is comprised to the compound to the animal and the cytokine-inducible kinase is confired to the cytokine-inducible kinase is conf
                                                                                                                                                                                     The invention describes a compound 8-80 nucleobases in length targeted to
New antisense oligonucleotides useful for modulating Cytokine-inducible kinase expression, useful for diagnosing, preventing or treating conditions associated with aberrant kinase expression e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "OTHER= Phosphorothioate backbone. All cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod_base= OTHER /note= "OTHER= 2'-0-Methoxyethyl (2'-MOE) nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      represents a human cytokine-inducible kinase antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treat diseases associated with the kinase expression, such as hyperproliferative disorders. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytostatic; antisense therapy; oestrogen-responsive finger protein; oestrogen-responsive finger protein associated disorder; hyperproliferative disorder; diagnostic; prophylaxis; human; antisense oligonucleotide; antisense technology; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding oestrogen-responsive finger protein. The compound specifically hybridises with the nucleic acid molecule encoding cestrogen-responsive finger protein (which comprises a sequence of 24295 bp fully defined in the specification) and inhibits the expression of estrogen-responsive finger protein. Also described are: a method of cinhibiting the expression of cestrogen-responsive finger protein, in cells or tissues; a method of screening for a modulator of oestrogen-responsive finger protein; a diagnostic method for identifying a disease state; a kit or assay device comprising the above compound; and a method of treating an animal having a disease or condition associated with estrogen responsive finger protein. The antisense oligonucleotide is useful for inhibiting the expression of oestrogen-responsive finger protein in cells or tissues to prevent or treat diseases associated with aberrant contissues tinger protein expression, such as hyperproliferative disorders. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human oestrogen-responsive finger protein antisense
                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonuclectides for modulating estrogen-responsive finger protein expression, useful for diagnosing, preventing or treating hyperproliferative disorders.

The invention relates to a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding BAF53 (a member of the BAF complex (BRG1/brm-associated factor 53kDa which is an actin-related protein), specifically hybridises with the nucleic acid encoding BAF53 comprising 28001-bp sequence (derived from human chromosome 3) and inhibits expression of BAF53, i.e. an antisense oligonucleotide. Also included are inhibiting the expression of BAF53 in cells or tissues, screening for a modulator of BAF53, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with BAF53. The oligonucleotide compound is useful for preparing a tumour. The present sequence is an antisense oligonucleotide targeting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding oestrogen-responsive finger protein. The compound specifically hybridises with the nucleic acid molecule encoding oestrogen-responsive finger protein (which comprises a sequence of 24295 bp fully defined in the specification) and inhibits the expression of estrogen-responsive finger protein. Also described are: a method of inhibiting the expression of oestrogen-responsive finger protein; a method of screening for a modulator of oestrogen-responsive finger protein; a diagnostic method for identifying a disease state; a kit or assay device comprising the above compound; and a method of treating an animal having a disease or condition associated with estrogen responsive finger protein. The antisense oligonucleotide is useful for inhibiting the expression of oestrogen-responsive finger protein. The antisense oligonucleotide is useful for inhibiting the expression of oestrogen-responsive finger protein in cells or tissues to prevent or treat diseases associated with aberrant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         oestrogen_responsive finger protein expression, such as typerproliferative disorders. In addition, the compound is used for diagnostics, prophylaxis, or as research respents or kits. This sequence represents a human oestrogen-responsive finger protein antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              estrogen-responsive finger

ö The invention relates to a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding BAF53 (a member of the BAF complex (BRG1/brm-associated factor). BRG1-associated factor 53kpa which is an actin-related protein), specifically hybridises with the nucleic acid encoding BAF53 comprising 28001-bp sequence (derived from human chromosome 3) and inhibits expression of BAF53, i.e. an antisense oligonuclectide. Also included are inhibiting the expression of BAF53 in cells or tissues, screening for a modulator of BAF5, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with BAF53. The oligonuclectide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer or a tumnour. The BAF53 gene is located on chromosome 3. The present sequence is a BAF53 genenic DNA target sequence for an antisense oligonucleotides. Gaps ö 0.4%; Score 15.2; DB 1; Length 20; 85.0%; Pred. Treatment of a condition e.g. allergy mediated by release of proinflammatory cytokine involves treating a patient with a cholinergic agonist selective for an alpha-7 nicotinic receptor to decrease the released amount of the cytokine.

Example 1; Page 40; 75pp; English

The inversion relates to a novel method for treatment of a patient cutfering from a condition mediated by release of proinflammatory cytokine e.g. appendicitis involving treating a patient with a cholinesgic agonist (al) selective for an alpha-7 nicotinic receptor to decrease the amount of the proinflammatory cytokine which is released from a macrophage. A cholinergic agonist has antiinflammatory.

CC decrease the amount of the proinflammatory cytokine which is released from a macrophage. A cholinergic agonist has antiinflammatory.

CC decrease the amount of the proinflammatory cytokine which is released antiallaried, antimalerial, immunosuppressive, vasotropic, vulnerary, antipyretic, immunomodulator, gynaecological, respiratory, CNS, anti-HIV, confider, antimalarial, antianginal, cardiant, antiarteriosclerctic, thrombolytic, antimalarial, antianginal, cardiant, antiarteriosclerctic, antiarthritic, ophthalmological, cytostatic, osteopathic, antigout, antiarthritic, ophthalmological, cytostatic, osteopathic, antigout, antiarthritic, ophthalmological, cytostatic, osteopathic, antigout, antigoriatic activity. A compound of the invention is useful for the treatment of diseases involving the gastrointestinal tract and associated tissues, systemic or local inflammatory diseases and conditions, diseases involving the respiratory system and associated tissues, diseases involving the central or peripheral conditions of the skin, diseases involving the central or peripheral conservative tissues, autoimmune and inflammatory disorders as expense or represents and connective tissues, autoimmune and inflammatory disorders as expense. invention relates to a novel method for treatment of a patient subunit of a nicotinic receptor.

This invention relates to the identification of a novel susceptibility locus AST-1 for asthma and other IgE mediated diseases mapped to the humann chromosome Toll4-pi5. Specifically, it refers to two overlapping genes namely GPRA (G-protein coupled receptor for asthma susceptibility) and AAA1 (asthma associated alternatively spliced gene 1). The present invention describes identifying single nucleotide polymorphisms, as well as insertion or deletion polymorphisms, occurring at different positions in the AST-1 locus, and furthermore providing vectors, host cells, primers and probes in order to determine the status of an individual. Accordingly, it provides a kit to diagnose or assess prediagosition to asthma, chronic obstructive pulmonary disease or cancer and other IgE mediated diseases including rhinitis and dermatitis, such that derived pharmaceutical compositions exhibit cytostatic and antiasthmatic activities. Furthermore, it provides a transgenic animal comprising the asthma locus-1 (AST-1) DNA. This oligonucleotide sequence is a 5' splice junction of the human AAA1 gene, given in Table 11 of the invention.

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding acyl-coenzyme A synthetase 1 (ACSI). The antisense compound specifically hybridises with and inhibits the expression of ACSI. The antisense oligonuclectides or compounds are useful for inhibiting the expression of acyl-coenzyme A synthetase 1 (ACSI), and for treating diseases or conditions associated with aberrant expression of ACSI, e.g. diabetes, obesity, metabolic syndrome X, cardiovascular disorder or cancer. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tunour formation. The present sequence represents an acyl-coenzyme A synthetase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compounds targeted to nucleic acid molecules encoding acyl-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 coenzyme A synthetase 1 (ACS1), useful for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Length 20;

This invention relates to a novel gene that encodes a protein exhibiting 20 alpha-hydration steroid dehydrogenase (20-HSD) activity, an enzyme involved in progesterone metabolism. Specifically, it refers to a mouse animal model that lacks the gene encoding this enzyme, and hence provides a model that can be used for the study of miscarriage resulting from the progesterone dysbolism of a parent or offspring. The present invention describes progesterone dysbolism as a cause of miscarriage in meal resource animals in the livestock farming industry, such that it provides a route to investigate a treatment method and/ or an early check up method with respect to reproductive disturbances occurring in these animals. This oligonucleotide sequence is a PCR primer given in an exemplification of the invention.

New gene encoding a protein exhibiting 20(alpha)-hydration steroid dehydrogenation enzyme activity, useful for metabolizing progesterone to inactive 20(alpha)-dihydroprogesterone.

family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FES, GUCY2F and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase stimulators. The invention may be useful for developing methods for detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a human-derived oligonucleotide which is related to the invention.

Activated mutant protein tyrosine kinases (e.g. NTRK3, FES and MCCK) as associated methods for diagnosing cancer and screening for anti-cancer

Disclosure; SEQ ID NO 1052; 363pp; English.

This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for anti-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FES, GUCY2F and MCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase stimulators. The invention may be useful for developing methods for detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a human-derived oligonucleotide which is related to the invention. ```
This is the nucleotide sequence of the PCR primer used for amplification in the method of invention, involving the treatment of type II diabetes with hepatic nuclear factor 4 (HNF-4). The agonists of normal HNF bicactivity can be used to treat diabetes, e.g. to ameliorate disease symptoms involving insufficient expression of an HNF gene and/or canadiorate disease symptoms involving expression of a mutant HNF gene or overexpression of a normal HNF gene. It is also useful to ameliorate disease symptoms involving expression of a mutant HNF gene or overexpression of a normal HNF gene. It is also useful to ameliorate disease symptoms involving a mutant (non-functional) HNF protein e.g. by administering a therapeutically effective amount of an anti-HNF antibody. Protein that binds to the mutant HNF-4 protein is useful in screening a sessays, e.g. to identify antagonists/agonists of an interaction between the Protein and a binding protein to develop drugs for disease treatment. CD Diabetes mellitus is a common metabolic disorder, and most cases are type II (non-insulin dependent diabetes mellitus (NIDDM)). A major genetic component is implicated, but few genes have been identified Mature onset the mutant HNDF have been identified and the form of the few genes have been identified and the few forms have been identified and the few forms have been incharated.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRP-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                        Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

The method is used to treat early onset type II diabetes and defects in insulin secretion. It is based on the discovery that certain mutations in the HNFI gene, encoding a transcription factor, are involved in these conditions

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and
Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Seguence 17 BP; 5 A; 4 C; 4 G; 4 T; 0 U; 0 Other;

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense

The INVENTION FIGURE to a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The INVENTION FIGURE acids may be enzymatic nucleic acid molecule which down regulates acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids is may be enzymatic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) promain an an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. The coll and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more contragines. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-creat lymphoma (MLL), bulky low-grade or follicular non-creat lymphoma (MLL), immunocytopenia, modeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytopenia, and inflammatory arthropathy. The NOGO-created with a cell to reduce NOGO ace in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the presence of a divalent cation that is preferably Mg^2+. Furthermore, the condition associated with the level of cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treatment may further comprise the use of one or more contented with a cell of acid any be used to cleave NOGO. The treatment may further comprise the use of one or more cell and treatment may further comprise the use of one or more cell and treatment may further comprise the use of one or more contented with a cell of acid any because, and entain and indices and may be used to cleamether may further comprise the use of one or more cell and erropathy, and/or other hardon or solvens and encoded or condition of condition aci constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury. The invention relates to a nucleic acid molecule which down regulates Sequence 17 BP; 3 A; 5 C; 3 G; 0 T; 6 U; 0 Other; sequence is an inozyme of the invention Claim 30; Page 148; 200pp; English

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO2). The regulates expression of a neurite growth inhibitor gene (NGO2). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NRY motif) propersion of CD20 in the presence of a divalent cation that is preferably MG 2+.

The coll and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more cherapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic treat lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic lymphoma (NHL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, comparing an anticle acid may be contacted with a cell to reduce NGO gene in the presence of a divalent cation that is preferably MG 2+. Furthermore, the crucial may be contacted with a cell to reduce NGO gene in the presence of a divalent cation that is preferably MG 2+. Furthermore, the coulcid may be contacted with a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of theraples. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNA) injury and cerebrovascular accident cation the modular dystem (CNA) alsease, ataxia, Huntington's disease, central encodes ataxia, Huntington's disease, central encodes ataxia, H Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and sequence is an inozyme of the invention Claim 30; Page 148; 200pp; English. central nervous system injury.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 30; Page 142; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegulates expression of a neurite growth inhibitor gene (NGCD). The cegulates expression of a neurite growth inhibitor gene (NGCD). The concleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NCM motif). The CD20-targetting nucleic acid is used to cleave RNA with a YCY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. The CD20-targetting nucleic acid is used to cleave RNA of CD20. The treatment may further comprise the use of one or more the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therefore in particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (NHL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cimmune thrombocytopaenia, and inflammatory archropathy. The NOGO gene in the concent of a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a collicular of nucleic acid may be contacted with a condition associated with the level of cell and treat a patient having a condition associated vict the level of noce

The oligomucleotides are 8-50 nucleotides in length, and are targeted to a nucleic acid encoding human B-raf and which is capable of inhibiting human B-raf expression. The oligomucleotides is used to inhibit the (abnormal) expression of human B-raf, to inhibit hyperproliferation of cells, to treat or prevent an abnormal proliferation of cells, to treat or prevent an abnormal proliferation condition, e.g. hyperproliferative disorders such as cancer (e.g. of the brain or nervous system), restenosis, psoriasis or a disorder characterised by T-cell activation and growth. They may also be used to diagnose these diseases, as well as atherosclerosis. The oligomucleotides of the invention may be used to distinguish raf-associated tumours from tumours having other etiologies. The antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises antisense oligonucleotides which are targeted to the coding region of the human helicase-moi gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of human helicase-moi in cells or tissues, and for traating a helicase-moi-associated condition. The antisense oligonucleotides of the invention may also be used to delay infection, inflammation and tumour formation. The present DNA sequence represents a human helicase-moi gene antisense oligonucleotide of the invention. NOTE: The present DNA sequence has a phosphorothicate backbone, bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antisense compound for modulating expression of human helicase-moi and for treating inflammation, specifically hybridizes to a specific region in nucleic acid molecule encoding the human helicase-moi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        are targetted to nucleic acids encoding human raf proteins and capable of inhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonuclectide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an antisense oligonuclectide targetted to human B-raf kinase
                                                                                                                                                                                                           Human; raf; hyperproliferation; neovascularisation; ocular angiogenesis; therapy; cancer; cytostatic; anti-angiogenic; vascular; ophthalmological; antisense; phosphorothioate backbone; B-raf kinase; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present invention relates to novel antisense oligonucleotides which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating cancer, angiogenesis or neovascularization by administering antisense oligonucleotides targeted to human raf sequences.
                                                                                                                                                                  Human B-raf kinase antisense oligonucleotide ISIS #14141.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.4%; Score 15; DB 1; Length 20;

The invention describes a method of preventing or treating tumour metastasis in an animal comprising administering to the animal an oligomucleotide 8-50 nucleotides in length, which is targeted to mRNA encoding human raf and capable of inhibiting raf expression. Also disclosed are raf oligonucleotides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleotides have cytostatic and antiarteriosclerotic properties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumourer. This sequence represents a human b-raf

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an exceptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchoodilation, increasing levels of ubiquinone or lung sunfactant in a subject, for reducing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing allergies, or a respiratory disease or condition, lung inflammation, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                                                                                                                                                                                                                                                                                    Aguilar D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.4%; Score 15; DB 1; Length 20; 100.0%; Pred. The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' end 3' intron-excn junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an artifinammatory steroid in a subject, for reducing of depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, a tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this parent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     which is targeted to mRNA encoding human craft, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoms), and which is capable of inhibiting raf expression. Also included is a composition comprising the oligonuclectide and a pharmaceutically acceptable carrier. The antisense oligonuclectide is useful for this inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo. is also is useful for treating or preventing a disease or condition associated with the expression of raf by administering it in combination with a chemotherapeutic agent to a human or cells of the human, where the expression of raf by administering of the condition is a hyperproliferative condition such as cancer, angiogenesis or neovascularisation (preferably ocular angiogenesis or neovascularisation). The oligo. is also useful for inhibiting hyperproliferation of cells. The oligos are also useful as tools, for example for detecting and determining the role of raf expression in various cell functions and physiological processes and conditions and for determining the role of raf expression in the condition and physiological processes and conditions and for determining the role of each example.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                 Novel antisense oligonucleotide which is targeted to mRNA encoding human raf and which is capable of inhibiting raf expression, useful for treating or preventing hyperproliferative conditions such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diagnosing conditions associated with raf expression and for research purposes. The present sequence is an antisense oligonucleotide targeting
                                                                                                                                                                                                                                                                                                                                                                                                             invention relates to an oligonucleotide 8-50 nucleotides in length
antisense gene therapy, chemotherapeutic agent, angiogenesis, hyperproliferative condition, neovascularisation, ocular angiogenesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The oligonucleotides are used in treating an animal having a disease or condition associated with hicase-moi, such as inflammation, a hyperproliferative disorder or a condition that arises from RNA-mediated

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 1602; 763pp; English.

The interior describes a nove composition (a) a liret active agent, comprising oligomuclectides, effective for alleviating control describes, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine (son for a proper control, when administered to a mammal. The oligomuclectides are derived from a gene encoding or regulating control or target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery or cancer and can be anti-sense to the kit. The composition of analgesic, hypotensive, insuppressive and for use of the kit. The composition of instructions for adding a carrier and for use of the kit. The composition of analgesic, hypotensive, immunosuppressive and cytostatic activity, is a confinent or an analgesic, hypotensive, immunosuppressive and cytostatic activity, is a confinent or accomprise oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, confinent or specification, pulmonary impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhintis, pulmonary contransplantation rejection, pulmonary impeded respiration, respiratory contransplantation rejection, pulmonary impeded respiration, respiratory contransplantation rejection, pulmonary infections, bulmonary disease, pulmonary intercibles by an an or condition such as pulmonary disease, pulmonary contresponding to the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the target RNA serves to prevent the breakdown of the oligonucleotides into product and the control of the contro This invention describes a novel composition (a) a first active agent,

t oligonucleotide containing less percentage of adenosine, targeted ( nucleic acids associated with lung airway or lung dysfunction, and Pharmaceutical composition for treating asthma, has antisense bronchodilating agent

Claim 15; SEQ ID NO 1650; 763pp; English.

This interior describes a novel composition, alleviating describes and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction or hyposecretion, when administered to a mammal. The cutacing adenosine sensitivity, levels of adenosine (A) or (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, of the invention as a national lergic, antiinflammatory, antiasthmatic, beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or mailgnant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, finflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system This invention describes a novel composition (a) a first active agent,

The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human DEXRASI polypeptide which specifically hybridises with the nucleic acid molecule and inhibits the expression of DEXRASI. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase compounds are useful for inhibiting the antisense oligonucleotides and compounds are useful for inhibiting the expression of DEXRASI and for treating diseases or conditions associated with expression of DEXRASI. e.g. hyperproliferative disorders such as cancer, neurological disorders or a disease or condition arising from aberrant nitric oxide signalling. The antisense compounds are also useful complylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. This sequence represents an antisense oligonucleotide target region of the invention.

The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human DERRASI polypeptide which specifically hybridises with the nucleic acid molecule and inhibits the expression of DERRASI. The antisense oligonucleotide comprises at least one modified sugar molety, preferably a 2'-0-methoxyethyl sugar molety, or at least one modified sugar molety, preferably a 2'-0-methoxyethyl sugar molety, or at least one modified nucleobase comprising a 5-metholycytosine. The antisense oligonucleotides and compounds are useful for inhibiting the artisense oligonucleotides and compounds are useful for inhibiting the expression of DEXRASI e.g. hyperproliferative disorders such as cancer, neurological disorders or a disease or condition arising from aberrant nitric oxide signalling. The antisense compounds are also useful as research reagents and kits or in diagnostic, therapeutic and prophylactic applications. This sequence represents an antisense oligonucleotide of the invention. This sequence represents an antisense
